getscrubless.com

Video is the one medium you still can't search.

- 500+ hours are uploaded to YouTube *every minute* — and that's one platform.
- Inside any single video, finding a moment means **scrubbing**: linear, manual, slow.
- Ctr⌘+F solved this for text 40 years ago.
- There is still no Ctr⌘+F for video.

The world's fastest-growing data type is also its least searchable.

Scrubless is Ctrl+F for video.

- Upload a video — or point Scrubless at a whole folder of them.
- Search in plain English: *“the part where someone is laughing.”*
- Click a result and the player jumps to that **exact second**.
- It searches what’s **shown** and what’s **said** — not just captions.

How it works

One pipeline turns every video into three searchable signals.

Frames become **CLIP** vectors (the visuals), audio becomes a **Whisper** transcript (the words), and **Claude** turns retrieved moments into cited answers. One search box over all of it.

Once a video is indexed, the hard part is done — everything else is free.

- **Library mode** — search across an *entire folder* of videos at once.
 - **Ask** — questions answered in prose, with clickable cited timestamps.
 - **Auto-chapters & summaries** generated on every upload.
 - **Highlight reels** — stitch the best moments into a shareable clip.
- Index once. Search, ask, summarize, and cut — from the same index.*

The pieces only just became cheap enough to put in one small app.

- **Multimodal embeddings** (CLIP) are good, fast, and open.
- **Whisper** drove transcription cost toward zero.
- **LLMs** (Claude) can now reason over retrieved moments and cite them.
- **Video volume** is compounding while tooling stays stuck on scrubbing.

The capability exists. The product doesn't — yet.

Every video library is a search problem waiting to happen.

- **Creators & editors** — find the take, the b-roll, the clip.
- **Teams** — meetings, training, support calls, all-hands archives.
- **Enterprise & regulated** — media, legal, security, compliance footage.

Bottom-up, the wedge is anyone sitting on hours of video they can't find their way through.

TAM — video management + enterprise search: ⟨insert your sizing here⟩.

Live in production today at **getscrubless.com**:

- **V1** — semantic search inside a video.
- **V2** — library mode across a folder of videos, durable per-user storage.
- **V3** — Q&A with citations, auto-chapters, highlight reels.
- Auth and **Stripe billing** shipped and working.

〈Add real metrics here: signups / waitlist / paying users / minutes indexed / week-over-week growth.〉

Freemium SaaS, priced on what costs us money: **indexed hours**.

- **Free** — a few minutes to feel the magic.
- **Pro** — monthly plan by indexed hours, self-serve via Stripe.
- **Expansion** — team seats, API access, on-prem / enterprise.

Cheap to run: one process, model and vector DB in-memory, fits on a single small instance — gross margin is on our side.

Competition

Approach	What they do	The gap
Transcript search	Find spoken words	Blind to visuals
DAM / MAM incumbents	Manual tags, enterprise-heavy	Not semantic, slow to adopt
Big-platform search	Search their content	Locked in; not your files

Our wedge: visual + spoken semantic search, dead-simple, running on *your own* videos.

- **Ernest Opara** — founder. *⟨background, prior work, why you're the one to build this.⟩*
- *⟨co-founders / early team / advisors, if any.⟩*

Built and shipped the entire product — V1 through V3, auth, and billing — solo, to production.

The index layer for the world's video. Every clip, meeting, lecture, and archive — instantly searchable, anywhere it lives.

- **Raising** $\langle amount \rangle$ to $\langle growth \cdot key\ hires \cdot enterprise \rangle$.
