getscrubless.com

Video is the one medium you still can't search.

- 500+ hours are uploaded to YouTube *every minute* — and that's one platform.
- Inside any single video, finding a moment means **scrubbing**: linear, manual, slow.
- Ctr⌘+F solved this for text 40 years ago.
- There is still no Ctr⌘+F for video.

The world's fastest-growing data type is also its least searchable.

Scrubless is Ctrl+F for video.

- Upload a video — or point Scrubless at a whole folder of them.
- Search in plain English: *“the part where someone is laughing.”*
- Click a result and the player jumps to that **exact second**.
- It searches what’s **shown** and what’s **said** — not just captions.

How it works

One pipeline turns every video into three searchable signals.

Frames become **CLIP** vectors (the visuals), audio becomes a **Whisper** transcript (the words), and **Claude** turns retrieved moments into cited answers. One search box over all of it.

Once a video is indexed, the hard part is done — everything else is free.

- **Library mode** — search across an *entire folder* of videos at once.
- **Ask** — questions answered in prose, with clickable cited timestamps.
- **Auto-chapters & summaries** generated on every upload.
- **Highlight reels** — stitch the best moments into a shareable clip.

Index once. Search, ask, summarize, and cut — from the same index.

The pieces only just became cheap enough to put in one small app.

- **Multimodal embeddings** (CLIP) are good, fast, and open.
- **Whisper** drove transcription cost toward zero.
- **LLMs** (Claude) can now reason over retrieved moments and cite them.
- **Video volume** is compounding while tooling stays stuck on scrubbing.

The capability exists. The product doesn't — yet.

TAM $\approx$ \$30B / year — the global spend on making video findable.

Bottom-up:

- **50M** pro / prosumer video creators $\times$ \$240/yr (Pro) = **\$12B**
- **30M** businesses with video archives $\times$ \$600/yr (Team) = **\$18B**
- **SAM $\approx$ \$7B** — English-first, self-serve + mid-market reachable today.
- **SOM $\approx$ \$50-150M** — realistic capture in 3-5 years.

Top-down cross-check: digital asset management ($\approx$ \$5B), enterprise search ($\approx$ \$6B), and video intelligence ($\approx$ \$11B) target the same need and triangulate to the same order of magnitude.

Shipped and live at getscrubless.com:

- V1 search, V2 library mode, V3 Q&A / chapters / reels — all in production.
- Auth + Stripe billing working; durable per-user storage.

Targets — next two quarters, post public launch:

- **1,000** signups in the first 90 days (Show HN / Product Hunt).
- **100** paying customers and **\$2K MRR** by end of Q3 2026.
- **10,000** hours of video indexed.
- **40%** week-4 retention on activated users.

Targets, not actuals — swap in live numbers as they land.

Freemium SaaS, priced on what costs us money: **indexed hours**.

- **Free** — a few minutes to feel the magic.
- **Pro** — monthly plan by indexed hours, self-serve via Stripe.
- **Expansion** — team seats, API access, on-prem / enterprise.

Cheap to run: one process, model and vector DB in-memory, fits on a single small instance — gross margin is on our side.

Competition

Approach	What they do	The gap
Transcript search	Find spoken words	Blind to visuals
DAM / MAM incumbents	Manual tags, enterprise-heavy	Not semantic, slow to adopt
Big-platform search	Search their content	Locked in; not your files

Our wedge: visual + spoken semantic search, dead-simple, running on *your own* videos.

Chukwuebuka Ernest-Opara — founder & sole engineer · Oakland.

- **ML & Platform Engineer at GEICO** — ships **embedding infrastructure** and ML deployment pipelines in production (Go · Python · Azure ML · Kubernetes).
- **Videographer for several years** before tech — has lived the scrubbing problem first-hand.
- **MS & BS in Computer Science** (Houston-Victoria; Babcock).
- Built **all of Scrubless solo** — V1–V3, auth, and Stripe billing.

In talks with two co-founders with media experience to lead content and go-to-market.

Built the embedding engine *and* lived the problem it solves — rare founder-market fit for video.

The index layer for the world's video. Every clip, meeting, lecture, and archive — instantly searchable, anywhere it lives.

Search was the gateway to the web. Scrubless is that gateway for video.

Stop scrubbing. Start searching.
